Using Epo-Grip Seam & Repair Putty with pastel chalks to color and repair an antler.

We have all used potassium permanganate for coloring antlers but has anyone ever added the dried mix to the putty? I stumbled across this today and wanted to share it thinking it may help someone out there. It goes like this:

Here I added brown and yellow chalk scraped off with a scapel to get closer to a bone base color!

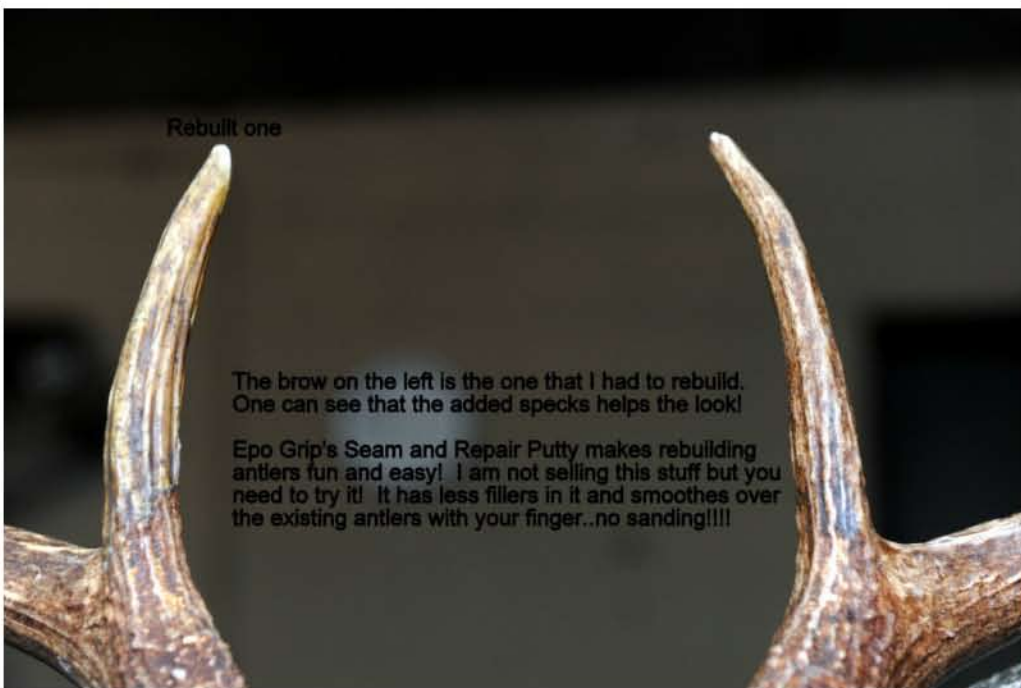

Here it is mixed up.

For an example to show I built this point on a rod to show how the specks show up. I had wet the putty and a small length of rubber coated electrical wire to make the gooves. I used Windex to wet both! The point looks lighter then the putty below because of the flash on my camera.

All done here was just stippled potassium permanganate and water onto the putty with several applications.

Rebuilt one

The brow on the left is the one that I had to rebuild. One can see that the added specks helps the look!

Epo Grip's Seam and Repair Putty makes rebuilding antlers fun and easy! I am not selling this stuff but you need to try it! It has less fillers in it and smoothes over the existing antlers with your finger..no sanding!!!!

Good luck and have fun!!!!
